

Building Science (Portland)

Take the mystery out of tight homes and moisture management by gaining confidence in your energy-efficient design and construction practices while optimizing your investment and reducing liability through superior building performance.

This course explores how properly designing and constructing a building's envelope, or thermal and moisture barrier, is essential for a comfortable, healthy, durable, and energy-efficient home. The course provides an exploration of the fundamental laws that govern the dynamic flows within a building in order to understand the interconnectedness of house systems. These fundamentals are necessary tools to use when making design, construction, and operation decisions that affect the sustainability of projects. Students will analyze best practices for managing thermal, air, and moisture flows to create a house that is healthy, safe, energy efficient, and durable.

Biohazard Clean-Up and Ethics (Salem)

SERVPRO® of Salem West invites you to participate in a free continuing education seminar, covering biohazard clean-up and ethics, presented by Steve Yerger.

Attendees will learn what customers go through when they experience biohazard losses, techniques used to mitigate biohazards, and issues facing biohazard vendors. Issues of

ethics, ethical relationships, asset protection, and work environments will be considered.

Attendees may earn 6CE hours, but registration is required and space is limited. To register, mail a \$15 refundable deposit with the following information to the below address:
